BrightPath Tech

Synthetic Supplier RFP Response — Agentic Evaluation Mini Project

Lowest-price and fastest-timeline proposition; weaker compliance detail and limited historical experience.

Confidentiality: Fictional procurement response created solely for classroom evaluation. No real supplier or confidential customer data is used.

Executive Summary

BrightPath Tech proposes a pragmatic implementation focused on rapid configuration, straightforward integrations and a low initial cost. The response emphasizes speed and commercial value, while some security, audit and reference details remain at a high level.

Understanding of Requirement

We understand the procurement team requires a scalable enterprise platform with integration, implementation governance, transparent commercial assumptions, strong security controls, and an operational support model. This proposal is designed to provide evidence for each evaluation criterion.

Proposed Solution

The solution uses a standard API integration layer, configurable workflow components, relational persistence and cloud-hosted monitoring. Common integrations are planned through REST APIs and scheduled data exchange. The proposal assumes the customer will provide identity integration patterns and infrastructure standards early in the project.

Architecture and Integration

The solution uses secure interfaces, environment separation, observability, controlled deployments and documented operational ownership. Integration dependencies and assumptions are identified so that proposal evidence can be distinguished from items requiring discovery.

Implementation Plan

A 12-week delivery is proposed: weeks 1–2 discovery; weeks 3–6 configuration; weeks 7–9 integration and testing; weeks 10–11 UAT; week 12 production launch. This schedule depends on prompt customer decisions and limited customization.

Team Structure

Team: project manager, solution consultant, two developers, integration engineer and part-time QA resource. Security expertise is shared across the wider engineering organization rather than dedicated to the project.

Milestones

1. Discovery and requirements baseline
2. Architecture and security review
3. Configuration and integration build
4. System and user acceptance testing
5. Production readiness and cutover
6. Hypercare and transition to support

Commercial Proposal

Illustrative implementation price: INR 1.05 crore, the lowest of the fictional proposals. Annual support is INR 15 lakh. Pricing assumes mostly standard functionality and limited custom integration.

Pricing Assumptions

Assumptions include customer-managed cloud/network setup, standard authentication, reusable connectors, remote delivery and no complex legacy migration. Custom reports and major data cleansing are change requests.

Delivery Governance

The delivery team will maintain a RAID log, decision register, milestone plan, issue escalation path, and formal change-control process. Customer approvals and environment readiness are dependencies for the stated timeline.

Security, Compliance and Risk

The response states that TLS, role-based permissions, vulnerability scanning and audit logging will be used. Certification details and retention periods are not fully specified. Privacy controls and audit evidence are described at a high level and require confirmation during discovery.

Key Risks and Mitigations

Risks include the compressed schedule, customer dependency on environment access and limited compliance evidence. Mitigations are weekly decision meetings, standard configuration and early integration testing.

Support Model

Business-hours support is proposed with an optional 24x7 escalation package. A shared support queue, monthly reporting and remote troubleshooting are included. Hypercare is two weeks.

Relevant Experience

BrightPath states that it has approximately three years of relevant implementation experience and a small number of similar engagements. The proposal contains less detailed reference evidence than the other fictional suppliers.

References

Example references are fictional: Harbor Retail — workflow configuration; Greenfield Logistics — API integration. Reference contact information is not provided.

Evidence Boundary

Only information explicitly stated in this fictional proposal should be treated as proposal evidence. Any certification, reference, price, timeline, capability or control not stated here must not be inferred by an evaluator.

Closing Statement

This fictional response supports the classroom demonstration of document extraction, evidence-grounded LLM scoring, validation, deterministic business rules and explainable supplier comparison.
